Vedron Gold Inc.: Drilling Results on the Davidson Tisdale Property, Timmins, Ontario

TORONTO, ONTARIO--

Recently Discovered High grade 600 foot level zone extended

Vedron Gold Inc., VG-TSXV, and Northcott Gold Inc., LAG-TSXV are pleased to announce the drilling results from the January-February 2004 exploration program on the Davidson Tisdale Property owned by Northcott Gold Inc. The program commenced in late January and was completed in late February 2004.

Vedron Gold optioned the property on March 14, 2003 and can earn a 50% interest in the property by spending \$5 million on exploration and development over 5 years. The work commitment of \$250,000 for the initial year has been completed, and the second year of the agreement calls for a further \$500,000 to be spent by March 14, 2005.

Exploration Drilling is targeting the main zone, a steeply dipping quartz-sericite-carbonate alteration zone that hosts relatively flat lying auriferous quartz vein systems "QVS". Previous work has established the presence of 5 significant QVS veins, situated at surface, 100 feet, 300 feet, 400 feet and 500 feet, or at the 1st, 3rd, 4th and 5th levels, (surface, 30, 100, 130 and 170 metres) and a new high grade vein system has been discovered below the limits of previous exploration activity at the 600 foot level or 200 metres below surface elevation.

The present program consisted of 8 completed holes and concentrated on exploring the lower vein systems and at depth below the existing workings and previous drilling. Results indicate that the potential for mineralization below the existing development and previous exploration is very good. Holes 325 and 326 intersected the new high grade QVS zone (600 foot level vein) that was first intersected in hole 03-315 (3.4 metres grading 121.15 g/t) located 50 metres below the known mineralization. The zone has been extended to the northwest and southwest of the discovery hole.

Results to date continue to demonstrate the on-going expansion of the high-grade underground resource, and indicate the presence of continued high-grade mineralization below the limits of historic mining and development, and previous exploration.

Some of the significant results from the February 2004 program are as follows:

4.0 metres grading 64.18 grams gold per tonne or 13.1 feet grading 1.872 ounces per ton

8.5 metres grading 30.05 grams gold per tonne or 27.9 feet grading 0.877 ounces per ton

23.0 metres grading 20.08 grams gold per tonne or 75.5 feet grading 0.586 ounces per ton

Hole 04-318 intersected the 5th level QVS from 182.5 to 186.5 and assayed 64.18 grams Au per tonne over the 4.0 metre interval or 1.872 ounces Au per ton over 13.1 feet. This extends the known mineralization to the west of the workings and previously known mineralization.

Hole 319 deflected off azimuth and was terminated at 35 metres depth

Hole 320 targeted at extended the 5th level vein to the northwest intercepted a 0.6 metre vein with no significant assays

Hole 321 targeted at extending the 5th level vein to the southeast failed to intercept QVS but encountered a fault zone prior to target depth.

Hole 04-322 intersected the 4th level QVS from 138.7 to 144.8 and assayed 6.0 grams Au per tonne over the 6.1 metre interval or 0.175 ounces Au per ton over 20.0 feet. This extends the QVS up dip to the southeast of previously known mineralization.

Hole 04-323 was targeted to test for 5th level mineralization up dip to the southeast. The extension of the 5th level QVS was intercepted and assayed 4.0 grams Au per tonne over 5.0 metres or 0.117 ounces Au per ton over 16.4 feet. The hole was extended to test for a possible east extension of the S vein and intercepted an S-zone style QVS from 224.4 to 229.7 which assayed 0.86 grams Au per tonne over 6.4 metres. This represents the furthest east intersection of the S-zone to date on the property.

Hole 04-324 tested 5th level vein and intercepted QVS with visible gold from 159.0 to 161.7 and assayed 9.18 grams Au per tonne over the 2.7 metre interval or 0.268 ounces Au per ton over 8.9 feet.

Hole 04-325 was targeted at the up dip and west and south projection of the 5th and 6th level QVS intersected in hole 315 (197.34 grams Au per tonne over 4.6 metres and 121.15 grams Au per tonne over 3.4 metres). The 6th level QVS was intersected from 195.5 to 218.5 and assayed 20.08 grams Au per tonne over the 23.0 metre interval or 0.586 ounces Au per ton over 75.5 feet. This extends the 6th level vein to the west and south and up dip of hole 315.

Hole 04-326 was targeted at the down dip and west and north projection of the 5th and 6th level QVS intersected in hole 315 (197.34 grams Au per tonne over 4.6 metres and 121.15 grams Au per tonne over 3.4 metres). The 6th level QVS was intersected from 251.9 to 260.4, west and north of 315 and 80 metres downsection of hole 325, and assayed 30.05 grams Au per tonne over the 8.5 metre interval or 0.877 ounces Au per ton over 27.9 feet.

The following table summarizes the results of the January / February 2004 drill program.

All exploration work was conducted under Kenneth Guy, P. Geo., designated Qualified Person for Vedron Gold. Analytical services were provided by Expert Laboratories, Rouyn, Quebec.

Drilling is planned to commence again in late March with another 2,000 metre drilling program.
