Vedron Gold Inc.: Drilling Results on the Ramp Gold Property, Timmins, Ontario

TORONTO, ONTARIO--(CCNMatthews - Oct. 25, 2004) - Vedron Gold Inc., (TSX-V:VG), is pleased to announce the drilling results on the Ramp Gold Property that Vedron Gold optioned from Globex Mining Enterprises Inc., (GMX-TSX). The property, located 40 kilometers east of Timmins has been developed by a ramp, currently flooded, in 1988 to a depth of 500 feet. The property is located a few kilometers north of the Destor-Porcupine Deformation Zone, encompassing a 5 kilometre strike length of the Pipestone Fault.

The initial drill program was directed at exploring the South Zone, an unexplored area situated 100 metres south of the developed gold zones. The South Zone had two previous (1999) drill hole intercepts that graded 16.0 grams per tonne Au over 1.4 metres and 55.0 grams per tonne Au over 0.3 metres. Vedron's best result in the current program on the South Zone was 15.1 grams over 1.0 metres in drill hole VR04-5 and intercepted the South Zone between the two previous holes drilled in 1999. The final two holes of this program were drilled to explore for the extension of the Ramp Zone which has been cut off by a diabase dyke.

Results for the August - September 2004 program are set out in the table below:

/T/

Hole#	Location	Az	Depth	Results - gpt equals grams per tonne Au / metres
VR04-01	L350W/400S	-50/az220	254	Mineralized Zones 10.88-21.45 nsa 64.8-81.95 nsa 148.4-154.3 nsa 204.5-212.25 0.52gpt/7.75m
VR04-02	L350W/398S	-63.5/az220	208	Hole lost in Fault Zone 1.01gpt/2.75m

VR04-03	L350W/398S	-55/az190	212.3	Mineralized Zones 9.6-29.25 - nsa 115.8-121.3 - nsa 171.49-171.61 - nsa 176.46-178.8m - nsa
VR04-04	L250W/280S	-46/az220	59	Hole lost in Fault Zone
VR04-05	L250W/250S	-55/az220	269	169.3-170.1 1.06gpt/0.8m 204.3-205.3 VG 15.1gpt/1.0m

11 holes			Total	1905

nsa means: no significant assays.

/T/

The drill program was successful in locating mineralization typical of that which hosts the historic 1994 gold resource estimate by Robert A. Bennett, P. Eng. Hole VR04-05 was drilled between the 2 high grade drill intercepts, drilled in 1999 as noted above (16.0 gpt Au over 1.4 metres and 55.0 gpt Au over 0.3 metres) and intersected a similar pyrite mineralized zone which assayed 15.1gpt Au over 1.0 metres. These 3 intercepts cover a potential 250 metre strike length. Further

exploration remains to fully evaluate the potential of this vein system.

The final two holes drilled the area of the historic resource estimate, holes VR04-10 and VR04-11 were drilled to the test for the western extensions, 25 metre step-outs, of the known gold zones, including the Ramp Zone, and intersected favorable mineralization but gold values were low. This was near surface exploration with the depth extent remaining open.

Geologically the property is underlain by tholeiitic basalts, komatiites and porphyry dykes that have been subject to several deformation events resulting in pervasive hydrothermal alteration, together with quartz veining which hosts the gold mineralization. Gold mineralization is found within several parallel east-west striking shear zones as well as northeast striking structures.

All exploration work was conducted under Kenneth Guy, P.Geo, designated Qualified Person for Vedron Gold who has reviewed this press release. Analytical services were performed by Expert Laboratories, Rouyn, Quebec.
